-----

Our whole solar system, along with all the local stars you can see on a clear dark night, reside in one of our galaxy's spiral arms, known as the Orion arm, as they orbit the supermassive ...

The Solar System, a cosmic neighborhood centered around our Sun, is a complex structure of planets, moons, and smaller bodies. From the rocky inner planets to the gas giants of the outer reaches, each ...

With each planet, moon, asteroid, and comet, the solar system tells a story of birth, destruction, rebirth, and motion--stories written in craters, frozen oceans, swirling storms, and ...

Inside the Sun's core hydrogen is fused into helium for billions of years, releasing energy which is over even longer periods of time emitted through the Sun's outer layer, the photosphere. This creates the ...

A solar system is made up of a star and all of the objects that orbit it--planets, moons, asteroids, comets and meteoroids. Most stars host their own planets, so there are likely tens of ...

This chapter describes our current understanding of the key processes that shaped our planetary system, informed by empirical data such as meteorite measurements, observations of planet-forming ...

there in our solar system?&quot; These may seem silly to those who know a bit about the subject, but even knowledgeable people are not really sure what constitutes the solar system, what objects are part of ...

Explore the fascinating composition and structure of the solar system, including planets, moons, asteroids, and their roles in our cosmic neighborhood.
