Are community energy storage systems a good investment?

As previously mentioned, most community energy storage projects in the United States are distribution sited and utility owned. The community indirectly benefits from cost-effective investments that reduce system costs. There is also the potential for distribution sited storage systems to improve local reliability and resiliency.

Are community energy storage projects community owned?

While this definition could enable several use cases, in practice most community energy storage projects feature direct utility ownership and control; they are not community owned. However, other models are emerging that tie the asset more directly to the community.

Should community energy storage be expanded?

An expansion of community energy storage will not necessarily lead to more equitable outcomes. Greater regulatory and financial support will be needed for these assets to be accessible to underrepresented communities. The "community" of community energy storage as a business model is broadly defined.

What are the development directions for mobile energy storage technologies?

Development directions in mobile energy storage technologies are envisioned. Carbon neutrality calls for renewable energies, and the efficient use of renewable energies requires energy storage mediums that enable the storage of excess energy and reuse after spatiotemporal reallocation.
