What type of corrosion protection is required?

Typical corrosion protection includes zinc galvanizing in accordance with the Standard Specifications. However, in corrosive environments such as in coastal areas, the splash zone, or underwater, improved corrosion protection may be necessary. Stainless steel is often specified instead of galvanized steel.

Can corrosion leak history be used to assess the effectiveness of cathodic protection?

1.1.2 CORROSION LEAK HISTORY is valuable in assessing the effectiveness of cathodic protection. Corrosion leak history by itself, however, must not be used to determine whether adequate levels of cathodic protection have been achieved unless it is impractical to make electrical surveys. J. Paul Guyer 2014 2. APPLICABILITY.

What should be included in corrosion design recommendations?

Corrosion design recommendations should be based on the worst case test results from the site in accordance with Department guidelines. Sufficient information regarding the number and location of soil borings, sampling, and testing should be included to allow a thorough review of any corrosion recommendations by Department staff.

What are some examples of corrosion protection?

Fasteners, concrete anchors, plates, and frames are just a few examples. Typical corrosion protection includes zinc galvanizing in accordance with the Standard Specifications. However, in corrosive environments such as in coastal areas, the splash zone, or underwater, improved corrosion protection may be necessary.

Ferrous metal equipment, including raceways, cable trays, and enclosures, must be protected from corrosion both internally and externally, except for threaded joints.
