The remarkable downfall in renewable power generation expenses in 2023 has emerged as a landmark in the energy transition. These trends forecast a stable future where sources like solar ...

IRENA reports that, between 2010 and 2023, the global weighted average levelized cost of energy (LCOE) of concentrating solar power (CSP) fell from \$0.39/kWh to under \$0.12/kWh--a decline of 70%.

Solar installations are set to slow next year for the first time since the industry emerged as a global force two decades ago, as policy shifts and saturation in major markets temper demand.

Declines in residential solar markets have been a hit to the industry--but its foundation is strong. We look at why the future is still bright for solar.

While natural gas, coal, and nuclear power remain dominant, their combined share of generation is expected to decline as renewable energy expands. Utility-scale solar is the fastest ...

The US solar industry installed 7.5 gigawatts direct current (GW dc) of capacity in Q2 2025, a 24% decline from Q2 2024 and a 28% decrease since Q1 2025. Solar accounted for 56% of ...

In the third quarter of 2025, solar projects representing about 20% of planned capacity reported a delay, a decrease from 25% in the same period in 2024, based on data compiled from ...

For solar PV, wind and bioenergy for power, deployment has been revised downwards. Solar PV accounts for over 70% of the absolute reduction, mainly from utility-scale projects, while offshore ...
