This study addresses these gaps by proposing an innovative solar-powered multigeneration system integrating PTSCs, supercritical and transcritical CO₂ cycles, and an RO ...

Increasing solar power generation in the U.S. by 15% could lead to an annual reduction of 8.54 million metric tons of carbon dioxide emissions, according to a new Harvard Chan School study.

Scientists have developed a sunlight-powered reactor that directly captures CO₂ from the air and transforms it into sustainable fuel. Unlike traditional carbon capture methods, this device ...

A team of researchers at the University of Cambridge has developed a groundbreaking solar reactor that captures carbon dioxide from the air and converts it into valuable fuels and chemicals.

These results show that total life cycle GHG emissions from renewables and nuclear energy are much lower and generally less variable than those from fossil fuels. For example, from cradle to grave, coal ...

By utilizing solar energy as a sustain-able and clean power source, this approach has the potential to mitigate CO₂ emissions and contribute to the develop-ment of a more sustainable and ...

The solar-driven conversion of CO₂ into long-chain (C₃+) products offers a sustainable pathway to mitigate climate change, produce carbon-neutral fuels and value-added chemicals.

NASA has developed a new technology that can convert the greenhouse gas carbon dioxide (CO₂) into fuel by using solar-powered, thin-film devices. Metal oxide thin films are fabricated to produce a ...
