Each year, NREL analysts publish benchmarks that track solar cost trends to support the U.S. Department of Energy Solar Energy Technologies Office's aim to accelerate the advancement ...

The latest cost analysis from IRENA shows that renewables continued to represent the most cost-competitive source of new electricity generation in 2024.

These benchmarks help measure progress toward goals for reducing solar electricity costs and guide SETO research and development programs. Read more to find out how these cost benchmarks are ...

Utility-scale solar is as inexpensive as \$0.02 per kWh, while onshore wind is as low as \$0.015 per kWh.

Starting in AEO2025, we estimate the levelized captured carbon credit that represents the revenue (negative cost) at a power plant with a carbon capture and sequestration (CCS) system.

Solar cell costs are influenced by numerous factors that involve manufacturing, material expenses, demand, and technological advancements. An understanding of these key elements ...

Utility-scale solar and wind power are now the lowest-cost sources of additional clean generation in many regions, with cost projections driving investment decisions and policy planning.

The cost of renewable energy has reached a historic tipping point in 2025, with solar and wind power now representing the cheapest sources of electricity generation in most regions worldwide.
