Hence, a wind tunnel was developed for the Institute of Energy Systems and Thermodynamics at the Vienna University of Technology. The study presented also provides a detailed insight into the ...

Pipe penetration seals Prevent fire, gas and water from spreading. Use the transits for new pipes or for retrofit around existing pipes.

What is a Wind Tunnel? A wind tunnel is a closed or open structure that generates a controlled airflow, which can be manipulated to simulate a range of wind conditions.

Airflow Sciences designs and fabricates custom wind tunnels for aerodynamic testing. Test section size can range from small (6"x6") to quite large (4"x8") depending on your needs.

Integration of horizontal heat pipes into multi-sided wind tower. Full-scale wind tunnel test used to validate numerical model. Maintains ventilation rates with increasing number of heat pipes. ...

To be able to test with supersonic flows, wind tunnels are used. To reach a supersonic flow, they must have a characteristic shape. Why is this? And how does this shape effect the flow? We will try to find ...

A wind tunnel is a tool used in aerodynamic research to study the effects of air moving past solid objects. A wind tunnel consists of a tubular passage with the object under test mounted in the middle.

In this present study, an anti-icing method, using the heat pipe technology, is proposed to prevent from icing on the blade surface, and the anti-icing energy is from the waste heat generated...
